| Another lowa Success | COUNTY AUDITOR WEEKLY REPORT <br> Prior to the discovery of petroleum in commercial quantitiy in Eastland County, agriculture was the principal industry in this County. During the boom period interest in agriculture waned and many farms were abandoned. But now that the petroleum industry is becoming of less importance as an asset to the County, farming and its allied interests are redeiving more consideration. Realizlng that the time would come when the oil supply would become exhausted and that we would be forced to again rely upon our agricultural resources for support, the County in cooperation with the Federal government, has kept employed for the past several years farm and home demonstration agents, who are especially trained for their work, to advise and | cooperate with agriculturists in the use of methods and means calculated to produce the best results. Those who have cooperated with these agents have doubtless benefitted materially. For the past two years the County has paid out of its General Fund for the services of these agents the following amounts: <br> Predatory animals, wolves in particular, have destroyed fowls, sheep and goats in this County to the value of thousands of dollars. Their depredations kept many of our citizens from engaging more extensively in | these industries, which are quite profitable when properly conducted under favorable conditions. To protect and encourage these industries, the County in 1929 joined the Federal and State governments in a campaign to exterminate these animals as nearly as possible. The County also pays a bounty of $\$ 5.00$ per scalp for woives and wild cats when caught in this County. For 1929 and 1930 the County paid out of its General Fund for the extermination of predatory animals the following amounts: <br> 1929 | Animal Industry Is An Important One <br> (Continued from page 1) <br> stomach, while others prefer the kidneys or other organs. The parasites deposit their eggs in these vital organs of the host animal. In case the lungs are infected the larvae may come up the windpipe into the throat and be swallowed by the infected animal and contaminate the ground and feed, and sometimes the feeding and watering equipment. In case the eggs do not hatch until swallowed by a host animal. <br> One pig, lamb, calf, or foal, or other animal of the same species, may harber hundreds or thousands of these parasites at one time. Thus we see that shelters, lots, paddocks, and the soil of overstocked pastures become heavily laden with parasite eggs and | larvae that pass from infected animal The feeding and watering equipment too, may become contaminated, and readily infect the animals exposed to these conditions. <br> Young animals are especially sus ceptible to the injurious effect of pa rasite infectation, while older or more mature animals have a higher power of resistance to the evil effects of parasites. <br> Farmers and stockmen must recogaize that newly born, and other young growing animals are no more able to protect themselves in worm contaminated premises than young, krowing plants can protect themselves against obnoxious weeds and grasses. Worn parasites stunt growth, make runts, and require longer periods for finishing animals for market. Literature on this subject may be obtained by ad dressing the U.S. Department of AgriState college of agriculture. It pays to practice parasite prevention. |
