Muleshoe, Bailey County, Texas, Friday, Sept. 18, 1925.

Number 31

### Texas Utilities Co. Ready To

The Texas Utilities Company has caused to be prepared a util ity map, a copy of which is published in this issue of the Journal, showing contemplated plans of the owners and operators of Texas Utilities Company and New Mexico Utilities Company to develop territory served by said companies in West Texas and East New Mexico, by acquisition of new electric utilities as an entirity as well as by construction of transmission lines and distribution systems. The advantages of the proposed plan for the development of the territory served by thes companies will be reflected in both service and rates to all consumers of the - combined or inter-connected properties.

EXPLANATION OF MAP. The map shows electric service supplied at the present time !n West Texas and East New Mexico by said companies; it also shows transmission lines under construction, as well as contemplated transmission lines to be contructed in the near future which, when completed, will serve to inter-connect the plants and distributing systems of the Texas Utilities Company with the plants and systems of the New Mexico Utilities Company. CLOVIS AND TEXICO UTIL-

ITIES.

A glance at the map shows the plans of the NewMexico Utilities Campany to inter-connect its Portales electric plant and system with the electric utilities now being operated by the municipality in the city of Clovis, New Mexico, and also with the Texico and Farwell electric prop- Liberty School Teacherties, now being operated by the State Line Utilities Comany. As indicated on the above mencioned map, it is the intention of the state of New Mexico for the ing, purpose of inter-connecting with the Clovis plant and system, as

#### **Bailey County** Teachers Organize

While the teachers of Bailey Build in Here county were in Lubbock at the teacher's institute, they organized the Bailey County Teacher's Association with the following as officers: H. O. Smith, president; Miss Ara Lee, secretary and Walter Workman, treasurer. The first meeting of the organization will be held at West Camp school house on October 16th.

> We, your committee, appointed to draft resolutions on organiz-Association, submit the following for your consideration:

That we respectfully request all teachers of Bailey county to join and cooperate with this association,

That we meet on Saturday at the end of the second month beginning with institute week, and at the end of the third month thereafter.

That the place of meeting be determined by the association.

That we invite speakers to address us at the various meetings the expense of the associa-

That the program committee and the social committee be appointed by the superintendent of the school where the school where the meeting is held.

That the expenses of the association shall be determined by the members af the association.

That all persons interested in education be invited to the meetings of this association.

That the purpose of this association is to promote the educational interests of Bailey county By the Committee,

Ethel Kistler. Eunice Page, Amelia Spencer.

### ers Entertain.

New Mexico Utilities Company were entertained by the Parent comes to Clovis on Sept- 25. to construct approximately thir Teachers' Association, last Frity miles of transmission lines in day evening at the school build-

The work of the association was discussed with great interfollows: Clovis to Portales, 18 est. Cake and fruit salad were miles, and Clovis to Farwell, 12 served, after which Mr. Adams thanked the people for the reception and for their spirit of cooperation in school work.

#### City Man Has to Cope With Much Discomfort

The high cost of living in a big city, the noise, the smoke and other discomforts are largely responsible for the phenomenal growth during the last ten years of the suburban zones around all large American cities. High land values in the city and high taxes have contributed toward making high rents. These factors are less important in the suburbs. In the cities the police frequently are unable to cope with crime. A city resident cannot always feel safe on the streets after dark or feel certain of the safety of members of his family. In the suburbs he has little cause for worry. If the city man is dependent on street cars or elevated cars for transportation between his home and office he must either live close to his place of business or in a locality that may be undesirable or spend an unnecessarily long time on the cars. A suburban home 25 miles from the city may be closer in actual time spent in travel than a city apartment half of that distance from the downtown area. Most cities have grown faster than their intra-mural transportation facilities; but the man who drives to and from work in an automobile is not much better off unless he can afford a chauffeur or can get down to work and back home before the rush hour.

#### Vacant Lot Usually More Than Eyesore

Every city has vacant lots. They are a part of the landscape, and lie singly or in pairs or in triplets and other numbers between houses. Vacant lots were meant to have houses built on them. Oftentimes, instead, they lie idle to grow up in weeds. While they are growing up in weeds they also are accumulating taxes and interest, which the owner has to pay. He doesn't wish to sell the lot at a loss and sometimes he doesn't wish to hold it any longer. In addition to growing weeds, a lot may be a convenient dumping ground for the neighbors. The absence of a lot would compel them to put their grass cuttings, tin cans and shrubbery trimmings out for the refuse men to take away. Sometimes, rather than carry ashes to the street front or the alley to be hauled away by the ashes collector, people will dump them on a vacant lot. Then when building operations begin, the ashes, tin cans, broken bricks, old furnace pipe, dead shrubbery, old shoes, old rubbers, etc., must be hauled away by the builder or turned under to furnish further trouble for the house buyer when he starts to dig s garden or flower bed.

#### Buried Town Hoodoo

At Daytona, Fla., a group of town boosters had a big ceremony on the beach and resolved thenceforth to devote their every effort to promote the welfare of their town and country. They decided never responsibility, whether that of voting, making true tax returns, supporting the best man for the public job or giving whole-hearted encouragement to the officials who are elected. In token of this they brought out an effigy of the familiar American alibi of "Let George Do It," and after mauling the figure all over the beach, buried it in a grave most wide and deep. It remains to be seen how long this conversion to a better manner of civic life will last. If it endures, other communities could try the plan, to their advantage.-Akron Beacon Jour-

#### Ford Sees Coming Change

"The modern city has done its work and a change is coming," Henry Ford said, in a recent interview. "The city has taught us much, but the overhead expense of living in such places is becoming unbearable. The cost of maintaining interest on debts, of keeping up water supply, sewage and sanitary systems, the cost of traffic control and of policing great masses of people is so great as to offset the benefits of the city. Industry of the future will be organized on a big scale, but competition will force it to move to parts of the country where labor is steady and overhead costs are low. Instead of making the man come to the city, we will take the work to him in the country."

#### Home Owning

In a few brief generations men have broken the chains that made the serf the slave of the land, and have made the land the servant of the freeman. He who neglects his opportunity, dearly bought by his predecessors, to shelter his loved ones under his own roof, is sadly like the man who fails to open his umbrella in the rain.-San Francisco Chronicle.

#### Cities in Competition

Twenty Wisconsin cities have entered a "better citles contest," and they will be judged in relation to public education, health, location, playgrounds, libraries, parks. At the request of Dr. John C. Callahan, state superintendent of public instruction for Wisconsin, Doctor John J. Tigert. commissioner of education of the Interior department, has designated Walter S. Deffenbaugh, chief division of city schools of the bureau of educe

#### SOME ADVANTAGES IN RAISING SHEEP

Farmers are becoming interested in raising sheep as a profitable undertaking. One of the first problems that comes up before the farmer who is interested in the proposition, is the advantages and disadvantages of sheep. There are several advantages in raising sheep, and with a little care most of the disadvantages can be overcome. In general, sheep raising will pay provided the sheep are given proper attention, says L. V. Starky, chief of the animal husbandry division at Clemson college, who gives below some of the advantages and disadvantages that the farmer may expect to find in sheep.

The outstanding advantage of the sheep industry is that they require less grain than any other class of live stock. This does not mean that sheep can get along without feed. There are times when they must have plenty of feed. A good grade of legume hay is one of the most satisfactory feeds.

Sheep will consume about 90 per cent of the weeds and bushes grown in the ordinary pasture. In this way they make the pastures better. They also spread their manure over the parts of the pastures which need it most. They seem to like to occupy the spots which are too poor to grow

There are two money crops, the lambs and the wool. It is often the case that the wool will pay for the feed and the lambs are clear profit. If the lambs come early they will bring a good price on the market.

Diseases, parasites and dogs are the three drawbacks to the sheep industry. Diseases and parasites may be controlled to a certain extent by changing pastures frequently. If sheep are brought up into a lot at nights dogs are not likely to bother them. Dogs very seldom attack sheep in the day time.

#### Proper Feeding Is Best in Growing Market Hogs

"Farmers will some day learn that it pays to feed hogs properly and market them wisely," says W. W. Shay, swine extension specialist for the North Carolina State College of Agriculture.

"On February 10," states Mr. Shay, "County Agent C. A. Sheffield of Davidson county weighed nine pigs belonging to J. E. Young of Lexington. At that time the pigs weighed 245 pounds.'

Tankage, red dog, and corn meal were mixed in what has been proven by the North Carolina experiment station as the best ration to meet the requirements of such pigs from the standpoint of both gains and profits.

"At the expiration of five weeks," says Mr. Shay, "the pigs were again weighed and feed in different proportions was mixed for another period of five weeks. This was continued That Lathers Freely during four periods of five weeks each, the feed being changed each time, and all the time an amount of corn equal by weight to the slop mixture was fed.

> As a result, Mr. Shay reports that, on July 1, the pigs were sold for 13 cents per pound. At that time they weighed 1,881 pounds and brought \$238.08.

After paying for all the other feeds at actual cost, these nine pigs paid \$2.21 per bushel for the 83% Lushels of corn which they ate during this 140day period. If Mr. Young produced his corn at a cost of 75 cents per bushel, the profit on that eaten by his pigs was \$122.29.

those who would dress smartly have, ment on the hat, but there are many through artistry and ingenuity of scarfs of varied fabrics for immediate stitch, taken unto themselves the very wear. Narrow ones, wound snugly appearance of fur. At first glance one would scarcely believe that the coat in are becoming and lend a touch of color this picture is really not astrakhan, to the sedate street frock or coat. but is knitted to resemble it. It is in Plaids and overchecks in natural or reseda green, with its only trimming fur tones, with borders in lively colors a mist-gray knitted brush-wool choker

collar and cuffs. What with its elegance, its loveliness, and above all, its general adaptits worth-whileness, to be taken seriously from now on and not as a mere passing fancy. In witness thereof con- exploited, but collar and jabot pieces constructed along modish straightline the strongest impression. Full jabots

about the throat appear to lead-they are very smart for autumn.

As an accessory to the frock or blouse, various versions of the jabot continue to lead the procession in neckability to practical wear, the knitted wear. Net and lace, georgette and coat graduates this season from the crepe de chine are the materials best novelty class demanding by virtue of suited to these pieces in which ruffled effects are featured. There is no end to the ways in which jabots are sider a fawn-colored caracul wool coat like that pictured appear to have made

the trims and stitches which mark this season's knitted topcoats. Therefore one need not depend on furlike effects only for variety. If one so will, one's coat may be knitted in jacquard patterning in the fanciful blister stitch or shell or a stitch which simulates plaiting, or a novelty zigzag stitch. Some coats are now knitted in tweed effects and these are mannishly finished with such details as tailored patch pockets, severe cuffs and conventional collars, with perhaps a leather button or more.

There are many pretty and novel neckwear pieces coming in with fall, both for wear on the street on

#### NEW MILLINERY MODELS

falling from high collars which fasten at the back have returned and are welcomed by the tailored woman who likes high neckpieces with tailored garments. Even mannish winged collars are shown on fallored blouses, whose only adornment is plaits, but the severely tailored mode is not along the popular trend; therefore the frilly jabot, in all its variations, may be concoded to be the wisest choice in neck

#### Plant Breeders Fight Diseases

Some of Ailments of Grain Held in Check by Cultural Methods.

(Prepared by the United States Department of Agriculture.)

Many and varied are the methods employed by scientific agriculturists to fight destructive diseases of the small grain crops. Some of the diseases of wheat, oats, barley, and other grains are held in check by cultural methods, some by seed treatment, and some by the use of "specialized fighting strains" of the crop in question. For some time plant breeders have been aware of the fact that some individual plants are stronger or more naturally resistant and immune to diseases than others. From these natural fighters the plant breeders for a long time have been assembling and mobilizing their disease-fighting soldiers and armies and deploying them to the farmer's fields to aid him in controlling his losses.

Highly Resistant Strains.

Strains of wheat, oats, barley and rye, as well as many other plants, have been discovered which are highly resistant or immune to a particular disease. From these a generous seed supply has been grown and distributed to the sections of the country where needed. This in itself has been an achievement of considerable note and value to the farmers of the country. Often it is necessary to find a variety or strain which is immune from more than one disease. As disease-resistant strains, in order to meet the needs of farmers, must at the same time be desirable in other characteristics of yield, market value, and adaptation, the problem of finding or developing "fighting strains" capable of resisting the attacks of several diseases is more difficult and intricate. Nevertheless, the plant breeders have come to the rescue of the farmer on such occasions as well.

Plan to Prevent Loss.

This was the case with wheat in the area of southwestern Illinois, where the two diseases flag smut and the rosette disease were causing great losses to the wheat growers. Fortunately among the various selections of wheat being grown by the United States Department of Agriculture in varietal tests at the Arlington experiment farm, one variety known as the Shepherd strain seemed to embody all of the desired characteristics. It was immune to both diseases and showed an average yield over a period of six years of 31 bushels to the acre. About 100 acres were sown in the infected area in southwestern Illinois in the fall of 1923 with seed from the government plats. From the product of this sowing enough seed was available for the sowing of a large area in the fall of 1924. Now many farmers have seed of the Shepherd strain of wheat and are growing it to prevent losses from flag smut and rosette.

#### Feed Mash to Balance

Up the Scratch Feeds Correct practice in feeding is the greatest factor that makes for success in the poultry business. One imporhat does not have so many followers as it deserves is the feeding of mash to balance up the cratch feeds which are usually grown t home.

hose who feed a mash in winter n quit feeding it as soon as the drifts melt away, for they think then the hen can get out of doors ould be made to rustle for her living. It is a mistake to do away with the mash entirely. Even though it is offered to the hens they will not eat as much of it as they will in the winter, but they will have an opportunity of balancing up their ration. This is essential in order to get a large quantity of eggs.

#### During Rest Period Cow

Should Be Fed Liberally During the rest period the cow should be fed enough to get in extra good physical condition before she freshens. There is no necessity and surely no economy to feed heavily during the dry period. Two or three pounds a day may well be fed, largely ground oats and bran, with some cornmeal if the cow is thin, and a small proportion of oilmeal. Then give the cow silage and good legume br

#### County Record for Use of Pure Breds

All Classes of Live Stock Included in List.

(Prepared by the United States Department of Agriculture.) With 592 live stock owners officially enrolled with the United States Department of Agriculture as pure-bredsire users, Pulaski county, Va., is the premier county of the United States in the extensive use of pure-bred males in live-stock breeding operations, so far as the department's records show. A recent report of the bureau of animal industry of the department notes that Pulaski county contains 843 farms reporting live stock, according to the last census, making pure-bred-sire users about 70 per cent of the total. The figure applies to live stock owners who use such sires for all classes of live stock raised, including cattle, horses, swine, sheep, and poultry. The census reports 970 inclosures, not farms, which would lower the percentage considerably, but would still permit the county to hold its premier position with respect to the wide use of pure-bred sires.

Union county, Ky., is the only serious competitor of Pulaski county. The figures given have added significance when considered in the light of reports which the department receives frequently on the benefits derived from the breeding of improved stock. From a financial point of view the widespread use of pure-bred sires may be expected to bring fully \$100,-000 additional returns to the farmers of a good live stock county. This estimate is based on calculations from county agent sources and is believed to be conservative. The bureau of animal industry has consistently urged the use of good pure-bred sires as a sound and practical method of live stock improvement. Responses from stock owners who have adopted the method have shown general satisfaction with the results.

#### Silage From Immature

Corn Good for Cattle

Immature corn can be made into a good feed for cattle by putting it into a silo, says J. B. Fitch, head of the dairy department of the Kansas State Agricultural college. Many silos were built this year to store the short corn crop. If above ground silos are not available and their purchase cannot be financed, pit silos, trench silos and silos made from flooring or other homemade silos can be used, according to

"When this corn has reached the point where it will not grow any more it should be cut and put into a silo or stacked," he advises. "If it is allowed to stand in the field the leaves will shatter off and the crop deteriorate quite rapidly when exposed to the weather.

"Immature corn is being cut this year with headers, grain binders, and mowing machines. When put into the silo the crop can be handled about the same as any other silage crop with the exception that this material cannot take up as much moisture as it would if mature. The amount of water added there should be watched carefully

"Silage from immature corn will not be equal in feed value to good corn silage, but the silo is a means of preserving this corn and changing it to Sell Old Fowls in Fall a palatable feed without loss."

#### Soy Beans for Pasture

Soy beans can be pastured by any kind of live stock, but they are more especially adapted to hogs than to cattle. For cattle our advice would be to harvest the beans and make hay. If desirable the beans can be permitted to ripen and be harvested for the seed and the straw fed to cattle, it having a higher feeding value than corn stover. The soy-bean seed can be ground and fed to cows in the place of cotton-

Remove brush and weeds from fence corners and ditches.

Quality, not quantity, is the impor-

tant consideration in dairy farming. Acid phosphate applied at the retg-of 150 pounds per ... just before seeding will pay on returns.

To adjust production to the demands the market is the pertinent probn of farm management.

A dozen horseshoes over the door on't prevent the "bad luck" that omes from not keeping apace with etter farm practices.

Can eggs while they are cheap, makng it possible to sell the fresh winter eggs at a time when they ring the highest price.

Soy beans containing between 30 and 0 per cent of dry matter when put nto the silo keep well and show no greater loss of nutrients than does

Cows that produce less than 9,000 pounds of milk and 325 pounds of butterfat a year are hardly worth keepng, Ohio cow-testing association recds indicate.

lowpea silage is somewhat more tent is fairly high the si-

#### Long Corn Shuck Gives Protection

Scientists Discover Method for Keeping Out the Corn-Ear Worm.

Prepared by the United States Department of Agriculture.) The corn scientists have found a way to fool the corn-ear worm. Now they are trying to develop a type of corn with a shuck extending well beyond the tip end of the ear for growing in the South, where the corn-ear worm is an active ally of another pest -the corn weevil. The corn-ear worm has a natural habit of entering the ear at the tip end of the shuck, eating his fill as he progresses down along the ear and finally cutting his way out when he is fed up. These holes made by his exit have proved to be ideal places for the weevil to enter and do further damage. The scientists have found that when the corn-ear worm enters a long-tipped shuck, however, he is more apt to bore out before he reaches the kernels, consequently doing less damage to the ear and also leaving fewer open doors for the weevil.

A number of years ago the United States Department of Agriculture showed that the weevils were unable to cut through corn husks, although they could eat the hardest rice popcorn without difficulty. The problem accordingly was to produce husk-protected strains that also would be good yielders. The problem was not a simple one, but some suitable and fairly desirable strains were found. Then it was discovered that the weevils were relying on the work of the corn-ear worm to gain entrance.

Now the problem is to develop a strain of corn that has long-tipped husks. As yet the experimenters are having some difficulty in developing a type with husks of sufficient length to fool the corn-ear worm and not too long to prevent the emergence of the silk, so that the ear will fill well. Some encouragement for the ultimate solution of the problem, however, lies in the fact that there is considerable variation among the strains in the length of husk projection that causes poorly filled ears. These strains will furnish the corn breeder with raw material to shape into the self-protecting, long-tipped variety that is wanted.

#### Pigs Quite Susceptible

to Cocklebur Poisoning The common cocklebur or clotbur has long been suspected of being poisonous but now its toxicity has been definitely established. Cattle are occasionally poisoned, but young pigs are most susceptible. The burs may produce mechanical injury but this is of secondary importance. Only young plants in the cotyledon stage are dangerous. The mortality from cockleburs is not high for the reason that, while they are widely distributed, they are seldom eaten. Pigs that have been fed milk cannot be killed with cockleburs experimentally. This suggests that probably the best treatment for acute cases is the administration of fats and oils, such as milk, bacon, grease, and linseed oil.-George H. Glover, Coloradó Agricultural college.

to Save Winter Feeding A good many people are adopting the idea of selling the old hens in the fall of the year after they quit laying. This saves keeping them through the winter. Besides the pullets are the best winter layers. Keeping the old hens only adds to the expense without increasing the returns proportionately.

The principal advantage in keeping the old hens over is to have enough of them to lay the eggs which are necessary for hatching. If only pullets are kept over the hatch may be disappointing.

People who follow the practice of buying baby chicks every spring should keep only pullets. These people can sell off the cockerels as soon as they are marketable. In this way they can keep their flock working at the highest possible rate of speed.

#### Quality of Silage

For the best quality of shage the crop must be put in at the proper time. Sorghums make excellent silage if not put in too green. Corn should go in when the kernels are glazed and denting but the sorghums must not go in until the heads are practically mature and the seed cannot be crushed with the fingers. The acid in sorghum silage is actually less than that in corn sliage when the crop is put in at the proper stage.

#### Rye Pasture for Hogs

Rye makes a splendid fall, winter and early spring pasture for hogs of all kinds. Fall pigs that have access to rye pasture during the winter make much better use of other feeds than plgs that do not have access to it. Brood sows that have access to rye pasture during the winter farrow stronger and thriftler plgs. Rye should be planted for pasture as early as moisture conditions will permit,

#### Spring Lamb Profitable

The spring lamb is the most profitable farm product farmers have been able to produce during the past few years. The spring lamb must be born early and fed well to make the most cult to make than silage from oth- profit. Ewes should be bred within the next four weeks if one expects to make the most money out of spring tation which takes place when damp e bitter and unpalatable. | lambs next year.

#### Why Clover Cannot Be Spared on Farm

Use of Crop Reduces Cost of Milk Production.

A good growth of clover on a farm is usually regarded as an indication that it is one of the best farms of the community. Despite its known value to the land only a small percentage of the farms show clover fields or fields of mixed clover and timothy. The amount of clover grown is relatively

small. A ton of clover hay contains about two or three times as much protein as a ton of timothy or red-top hay, according to experiment station reports. which shows the superior value of clover as feed. Experiment station statisticians estimate that a farmer who feeds clover instead of ordinary grass hay reduces the cost of his milk production 25 per cent. The Connecticut station makes this estimate.

A bulletin from this station also calls attention to the value of clover in maintaining the mineral reserves in cows and young stock. The value of clover hay is greater per ton and the yields are greater than grass hays per

Efforts to grow clover were slackened when feed could be bought easily and cheaply. The soil does not contain as much lime or mineral plant food as it once did, but the chief difficulty has been the use of Italian seed not adapted to our climate and plants from which have not proved hardy. Failures are to be expected unless seed is sown in northern climates which is known to have been produced under similar climatic conditions.

Seedsmen are now, after many difficulties with imported seed, sticking only to imported seed they know will prove hardy and to home-grown seed. Many soils need liming for clover crops, Lime makes the crop much more certain and more bountiful. When clover does not flourish lime should be applied. Red clover yields much more quickly to the beneficial results of time than alsike, and when both are sown and the red clover fails, lime is needed.

#### Immature Blue Grass Is

Most Excellent for Pasture Immature Kentucky blue grass excels all eastern pasture grasses, and also legumes grown for hay, in nutritive value, says investigators at the agricultural experiment station at the

conducted special studies. The blue grass contains 50 per cent more digestible crude protein than was found in the average of 44 other east-

Pennsylvania State college who have

ern pasture grasses. Pennsylvania climate is well adapted to the growth of Kentucky blue grass. Throughout the state it may be-found growing on limited areas along roadsides, in well-kept lawns and in the vicinity of barnyards. However, it is not well developed on extensive pasture areas, except in sections of Greene and Washington counties. For maximum growth as a pasture grass, the soil should be treated with limestone and a complete fertilizer, the research

#### To Eradicate Thistles

thistles less next year, besides the sav- an intense love for, and thorough uning in fertility. A good way to cut the thistles is by using a sharp hoe or scythe. The work may be done any time. Cut them closely to the ground. If there happens to be other noxious weeds they might be cut at the same time. After two or three cuttings the roots will die and the plants will not grow. The only sure way of controlling these noxious weeds is by cutting them, before they go to seed, a few times.

Practically none of the corn nutrients are lost in "hogging off."

Give strawberry plants care now if you want a maximum crop in 1926.

Soy-bean silage differs from corn silage, being richer in protein but lower in energy.

Human labor and horse labor are by far the largest items of farming costs. Keeping watch of both pays.

Mixed with corn at the rate of one load of cowpeas to two loads of corn, a good high protein silage is pro-

The United States has approximately one-sixteenth of the world's population, but about one-seventh of the world's food animals.

Cutting in the bud stage decreases the vigor of growth, the stand, and the yield of alfalfa hay and permits the encroachment of grasses.

Whether you find it best to fill your silo alone or to co-operate with your neighbors, it is none too early to make definite plans and to place orders for any needed equipment.

Purchased feed costs more than home-grown feed because the user has to pay for hauling it from someone else's farm to the feed cill and then back to his own farm.

Heat-damaged wheat causes a bitter taste and dark color to the flour. Heatdamaged kernels are caused by fermengrain is stacked or stored in a bin.

### THE PASSING DAY

WILL H. MAYES Former Dean Department of Journalism

University of Texas

Good Man in a Good Place. The dirt farmers of Texas and those who intend to become dirt farmers are to be congratulated that T. O. Walton has been chosen president of the A. & M. College. Walton has no Phiddle-

Dee-Dee degrees, but he does know practical farming and the farmer's problems. He has never written a thesis on the Doodlebug's Daring or any other scientific subject so far as I know, but has made a life-long practical study of farm life and farm work. He has first-hand knowledge of almost every phase of farming, and is a hard worker who will put the very best that is in him into what was contemplated in the founding of the college-into making it a school for the teaching of farming. If he does not do that very thing, then I am a poor guesser and have sized up President Walton wrong.

Agricultural College Needed.

There has been a feeling for some time that the A. & M. College has been steadily getting away from its real purpose of teaching young men to farm. The necessary courses have been offered, it is true, but students have not been impressed that they should become farmers. The recent educational survey shows that of the 2,300 matriculants in 1923, there were eighty-two graduates in the department of agriculture, only twelve of whom went into farming. Texas needs thousands of farmers with a scientific knowledge of agriculture and it was to fill that need that this school was established. It has not been the fault of President Bizzell and his predecessors that the students have not become farmers unless it be that they did not sufficiently emphasize the dignity of farming as a life work. This President Walton will doubtless do, for he is distinctly a farmer with an appreciation of farm life, while the others before him have been educators to whom farming has been merely incidental.

Value of Scholarship Degrees. Those without college degrees need not seek consolation in the fact that President Walton is not also Dr. Walton. A university degree is a good thing and much to be desired, and of course it follows that the higher the degree the more valuable it becomes, unless the application to study necessary to secure the degree causes overemphasis to be placed on theory to the neglect of practice. This is so often the case that the world is likely to regard a doctor of philosophy as a wholly impractical being absorbed only in acquiring more and more knowledge and unable to apply his mind to the more lowly practical things in life. So we do not expect the Ph. D. to be especially interested in practical farming, or in teaching others how to farm, or to be able to make farming, or other vocational life, alluring to students. There are exceptional Ph. Ds. who can do this, but they are rare. The best vocational A thistle cut now will mean many reasonable amount of scholarship and derstanding of, the vocation they teach. That is why President Walton qualifies so well for the presidency of the Texas A. & M. College.

Alvord Ready to Step Up. In elevating T. O. Walton to the presidency of A. & M. College the board knew that it was not calling on the extension department to make any great sacrifice, because it had in C. H. Alvord, of Bexar county, a man thoroughly qualified to succeed him. Alvord is a soil tiller and a man who knows how to take practical farm training right to the farmers of the State. He is a bunch of energy and enthusiasm about farm work and farm life. He is going to help make the college a school with its chief purpose to turn out farmers who will till the lands of Texas and do it with pride in their labors.

Jumping on the Press.

It is seldom that an educator taiks dow-a-days without saving something disparaging about the press, even though his subject may have nothing whatever to do with the relation of the press to the people. It would seem that teachers think that in belittling the newspapers they elevate themselves in public estimation. "The newspapers are full of glaring errors and exploit things that should not be made known. They do harm rather than good," they assert. If the newspapers are open to criticism, it is largely because the writers and editors, themselves the products of the schools, have not been properly trained by the educators. Therefore, the teachers who criticise the press criticise the educational system of which they are parts. Why not confine their criticisms to the fountain source, the schools, rather than to the product? The truth is the press is the strongest ally of the school in educating the people, and deserves as much com-mendation as the school for the good it is doing.

It will continue to make mistakes of course, so long as the human mind is frail, but its mistakes are no greater than those of the school room.

That ten and a half inch rain in 24 hours at Brownsville was probably a reminder to the people down there that they should hurry up their flood conservation program.

The unusual success of almost every county and community fair held in Texas indicates that the old State is prospering in spite of the severe drouth throughout Central Texas.

#### "WENT HOME"

SYNOPSIS-PART ONE-At merry party in the studio apart-ment of Carter Blake, New York, Jerry (Geraldine) Harmer, Prudence's daughter, meets Duane Allerton, wealthy idler. He admires her tremendously and she likes him. But Allerton gets a bit exhilarated, with unfortunate results.

#### CHAPTER I-Continued

At three o'clock in the morning they went again to the kitchen for something to drink. His eyes were heavy now, his voice a little thick. He had been drinking more than Jerry realized, for she, having barely moistened her lips with the potent liquor, was still alert with the glamor of youth, and excitement, and romance, her natural brilliance only slightly fanned, not feverishly inflamed, by the seductive drink. Duane filled the small glass for her again, but as she put out a reluctant, unrefusing hand to take it from him, he withdrew it suddenly and placed both bottle and glass on the table behind him.

"Jerry," he whispered, his low voice a little strained, "you beautiful thing!" Irresistibly stirred by her beauty, emboldened by the extent of his drinking, his hand audaciously left her fingers, crept toward her shoulder, pressing in suddenly upon the soft f.esh beneath her arm viere the flame colored gown drooped away. And then, with increasing eagerness, he bent over her and pressed his hot lips upon the tender softness of her slender throat, and again, before she could move to repel him, upon her innocent and trusting lips. Jerry lay limp in his arms for a moment, and then went suddenly rigid, tearing herself away as though he had struck her.

Humiliation, mingled rage and scorn blazed in her bitter and disillusioned

"Oh, that" she cried, her voice, though harsh with the pain of her accusation, still carefully controlled that none in the room outside might hear, "That! It's all you think ofany of you— It's—"
A wave of shame, disappointment,

swept over her. Tears came to her eyes. "And I thought-I was fool enough to think-

"Wh-what did you th-think?" he asked encouragingly, rather pleased than otherwise by the initial denial which would give her final yielding only a greater charm. "Wh-what did you th-think, you beautiful thing?

"I thought it was falling in lovelike Prudence." She confessed humbly, crushed by the completeness of her disillusionment.

His infatuation fanned by the frankness of her admission, he reached out a hand to her again, a hand that trembled a little.

"Love!" he repeated. "It is love This is what love is."

"Don't touch me, you horrible-Words failed to express the extent of her scorn. "There's no such thing! I

He was surprised that she waited for no further argument, but whirled about, an outraged, lovely figure in the seductive flame-colored gown, and ran from the room. At the door, though, she paused, turned back. He had reached for the glass upon the table, had it within his grasp.

She spoke to herself, not to him "And to think I was looking forward to it all my life-sure of it-and

"Sure of wh-what? Expected wh what?" He delayed to take the glass. "That it would come to me the way It came to-Prudence."

Then she went out. Duane waited a moment. She did not come back. He filled his glass and drained it. Then he straightened his collar, unsteadily, and went into the studio to find her. She was not there. He wandered about the room, aimlessly for a while, waiting for her. She did not come. He crossed to where Rhoda, indifferent, misty-eyed, sat with Carter Blake in the window seat.

"Where is she?" he asked. "Your little friend from Iowa?

Rhoda lifted her head drowsily from Carter's shoulder. "Went home." she said, and her head drooped again.

"She said she had a headache or something," Carter explained. "Got her cloak and went out like a flash. Korzky's gene down to put her in a taxi."

Duane was irritated. The little quitter! And after the way she had encouraged him all evening. He held It a manifest unfairness to end a game so pleasant in such a silly, childish manner. He went out and down the stairs, hoping to overtake her. On the second landing he met Korzky com-

Ias she gone? I was going to take home," he explained lamely. Said she was feeling rotten," Korz

-a wide-eved and wondering martyr. along with thirty-nine other wide-eyed and wondering martyrs, upon the altar of education.

"And what is your name, my dear?" questioned a well-meaning teacher with a kindly although stereotyped smile, gazing down into the depths of the solemn blue eyes.

"Fairy Harmer." The voice vas soft but confident. Fairy Geraldine was not a timid child.

A wave of muffled giggling swept through the ranks of the thirty-nine. "Beg pardon, dear-what?"

"Fairy Harmer - Fairy Geraldine Harmer," said Prudence's daughter firmly, though hurt, cut to the quick, in this, her first encounter with the thoughtless cruelty of childhood.

A painful flush suffused the fair. soft face as the laughter swept the serried seats again.

The small face, barely visible above her plate, as they sat at dinner that night, was pale with the first great conviction of her life. She looked at her father, looked again to her mother.

"I want another name," she said, in the tone of one long accustomed to the receiving that comes fast on the heels "Will you take it now, or wait until

you get married?" queried her father facetiously. Prudence was never facetious at the

expense of a troubled daughter. 'Why, sweetness?" she questioned gently. "Why?"

"The teacher said, 'What is your name?' and I said, 'Fairy Harmer.' The childish bosom rose with the weight of indignation it had borne

'Don't Touch Me. You Horrible-Words Failed to Express the Extent of Her Scorn.

throughout the bitter day. "I didn't blame them for laughing," she went on in a tone of dispassionate justice. I would have laughed, too, if it had been anybody else's name."

Her parents digested this in sympahetic silence.

"And when we had recess," the vounded voice went on, "the boys said, Fly away, Fairy, 'cause fairles have wings.' It is a crazy name, mother," she finished with vast conclusiveness.

Prudence was the soul of gentle sympathy, but what could one do? Her baby had been christened in a thoughtless hour for Fairy, the deeply oved sister.

"It might hurt feelings, sweetness, if we should call you something else," she pleaded.

Fairy Geraldine said no more. But she was not dissuaded. She merely waited until the propitious moment to take the bull by the horns. When Aunt Fairy came to Des Moines for the next annual visit, a wheedlesome niece, Fairy Geraldine, sat in the lap of the lovely auntie who had no baby of her own, caressed her with tender dimpled fingers, adored her in pretty childish gurglings, and when Aunt Fairy was reduced to the point of

abject worship, she whispered softly: "Auntle, dear, sweet auntle, would it hurt your feelings if we call me semething else besides Fairy?-I think you're the loveliest auntie that ever was, but it is a crazy name, and

they laugh at it." "I've laughed at it myself a good many times," agreed Aunt Fairy amiably. "I don't blame you a bit for changing it. Your uncle says he wouldn't call a nice dog 'Fairy.' Change it, by all means, my dear. Anything from Fay to Floriette is bet-

ter than Fairy." The "Geraldine" that had been christened neatly in between the Fairy and Harmer obviously sufted her purpose to perfection and was solemnly agreed upon and pressed into tardy service.

And in time Geraldine became Jerry. and little Jerry Harmer smiled forgiveness upon the relenting of an unkind fate. It was difficult at first-but the small Jerry was a child of

deep purpose and strong conviction.

Every spoken "Fairy" was softly but firmly corrected. "You mean Jerry." And FA Surposingly sheet

time Fairy was forgotten and Jerry held the day.

Jerry's attitude toward life in general was much like that-what she liked she adored, what she disliked must be changed as quickly as possible. Until it could be changed, si endured it with Spartan resolution.

When Jerry was twenty years old, having been graduated from the state university, where she had acquired in every word and gesture. Prudence fair honors in things scholastic, unrivaled ones in things social, she cast about in her truanting thoughts for a legitimate avenue of action for those boundless, effervescent spirits of

She was a long time making up her mind, there were so many places one might go, so many things one might do. "I hink perhaps I'd better go to New York and study art," she said.

But long before she said it Jerry had

quite decided that she would go. Prudence, with a great sinking in her breast, agreed by all means that she should certainly do that very thing. So much being settled, Jerry went on to discuss her plans, and to air her views of life in general.

"It isn't that I resent your author ity, not in the least," she assured them. "But I want to be thrown on my owr, you know-I want to be free."

She crossed the room to the golden cage where a golden canary sang blithely in the sunshine. She opened the door. Upon the instant the bird leaped out into to brightness of the room, and circled once about it, with a brave flashing of its yellow wings.

"Like that," Jerry said. "He wants to be free." The bird flew contentedly back into

Its golden cage. Then Jerrold, the father of Jerry, valked slowly across to the cage, his hand outstretched to close the tiny door. But before he could lay his finger upon it the flashing bit of gold leaped out into the brightness of the room, and then back at once into the familiar confines of the cage, still with his sharp eyes on Jerrold's hand, to make a dash for freedom at his slightest movement toward that door. Again and again he reached toward it, and each the the bird leaped out to freedom. And each time returned quickly to the spacious cage.

"It isn't freedom itself that he wants," said Jerry's father gravely. "He doesn't know what freedom is. He likes the cage much better than the open spaces, but he hates that closed door. He is glad to come back to the cage, but he wants to think he is free. Is it the same with you,

"You can be free here, Jerry, !f that's all you want," Prudence put in quickly. "Do what you wish, go where you wish, think what-"

Jerry shook her lovely head, smiling. "Perhaps you do not do it on purpose," she said. "But you are a closed door, mother, and you can't help it. Prudence either by name or nature is a restraint-no fault of yours, you understand."

Jerry was vastly pleased with her decision to study art. Art seemed of all things in the world the most glam orous avenue to life. She had always taken a pleasant interest in pictures. and in college had been quite a favorite in the art department, where her work both in water colors and in oils, with somewhat of judicious oversight by a friendly instructor in the department, had received warm praise.

Perhaps, however, she was a little troubled in the secret places of her own heart, for she reverted to the subject many times every day, aithough it was already fully settled she should

"One has to do something, you know," she said. "One isn't born just for the sake of living and dying and getting it over with. One has to do something!"

"Of course!" Prudence was very positive in her agreement.

"Give you a job in the plant any time you say," her father offered quickly, who as president of one of the largest motor corporations in the Middle West was in a position to indulge in such largess if he chose.

"You don't understand, father," she said patiently. "Taking a job from a good worker who needs it to give to a poor one who does not need it, will never solve any labor questions. It isn't a matter of physical labor, you know. It's adding to the general richness of the world-it's putting some thing of yourself into circulation." "Don't get you." Jerrold was frank-

ly puzzled. "I-I think I know what you mean,"

Prudence said pleasantly. "Oh, no, you don't, mother," Jerry contradicted promptly, with laughing. ender eyes-not rudely. Jerry was obliged to contradict her mother many many times, but it was always with laughing tenderness that she did. "You just say so because you think it is your duty, having me for a daughter, to try to account for my foolishness."

Prudence blushed. "Anyhow we have all agreed that must go to New York to study art." "I never agreed to any such thing."

sald Jerrold flatly. "I-I did." said Prudence weakly. Jerry laughed softly at her mother. 'You didn't, either," she denied ten-"You're just siding with me to make father ashamed of himself. You think it makes me less ridiculous when you agree with me.'

Prudence blustred again. Prudence, at forty-four, with daughter twenty years old, was but a deepened, sweetened, softened molding of the Prodesta who. At mi

houseful of younger girls, and her gentle father. Se slender she was now as to appear almost frail, and sae was very pale, with but the slightest hint of rose in her lips, the lips that had the old whimsical, humerous droop of her girlhood days. In spite of the delicate frailty of her face and ngure, and the pallor of her creamy skin, Prudence did fot look her years, nor did her appearance in any way suggest the dignity of a grown-up daughter to her credit, even with the humorous depth of understanding and

hed taken such gay and masterful

charge of the parsonage, and the

and a glad acceptance. To Prudence sometimes, looking backward, it seemed a long way she had come from the cares and the responsibilities of that simple parsonage life. Times had changed. conditions, interests had changed. It seemed to Prudence that she alone remained steadfast and the same. Her father had died ten years before, and a ter that Aunt Grace, with Carol and Carol's baby, continued on in the home they had chosen in Mount Mark, remaining there to be near Lark and

Aunt Grace had lingered but a few years longer, and then slipped on into the shadows, having left the full of her modest means to Carol, the only one of the parsonage girls to be left alone and without resources. Fairy and Gene, the college lover who became her husband, had suffered a long series of financial reverses in their effort to forge to the front, but finally, after so many years, were comfortably settled in Chicago, seeming at last to have exhausted their store of ill for-

The youngest of the sisters, Constance, who had astounded them all by abandoning her dreams of literary fame to marry her prince among cowboys, Martin Ingram, had never regretted her judgment. Martin's vast and barren Arizona acres had been found to overlay an inexhaustible treasure house of oil, and Connie and her husband with their two small children were now living in affluence, and, better still, in matchless domestic bliss, in Englewood, one of the most charming suburbs of New York.

Jerrold was consoling himself with the knowledge that this level-headed and serene young auntie, supported by an imperturbable husband, would be at hand to see to willful Jerry on her arrival in the terrible city.

he said complacently.

agreed to this drastic inhibition. "I must be independent, you see,

studio apartment near her." "Rhoda - Rhoda La Faye that?" Jerrold wanted to know.

mean the girl who-"Rhoda was a very nice girl if she was expelled," Jerry said. "She-sh. was a little too-well, emancipated for Iowa, perhaps, but there was nothing in the least bad about her. She was a very talented girl, and new she has a studio in New York, and has illustrations in the very best magazines and everything. She can help me a great deal, I should imagine.'

"Well, I am certainly not in favor-Jerrold had assumed his most pater nally dictatorial voice.

"I am," interrupted Prudence quick "I am most heartily in favor of it Rhoda was not at all an evil-minded person, just mischievous, as I remember it, and her experience will be of great value to Jerry."

"What was she fired for, anyhow?" Jerrold wanted to know, moodily, feelin the handicap of his position ba tween the two of them.

"Well, here's a glimpse of Jerry in home surroundings and of what she wants out of life. Will she find it in New York?

(TO BE CONTINUED.)

#### T. R.'s Three Speeches Sir William Reach Thomas, English

war correspondent, in his book, "A Traveler in News," tells the following anecdote about Colonel Roosevelt, whom he met in the United States: "Whether or no he possessed a great brain may be debated, but I never met a man who had so much control over his mental processes. A friend told me that he had heard him address a crowd in the open air on a windy day. Only those toward whom he turned could catch what he said: so he spoke three speeches-one to those on the left, one to the center, one to the

right. The three speeches were differ-

ent and were given in alternate sen

tences; but he managed the triple feat

without confusion, without pausing for

the warmth of sympathy that showed at any age would be ageless, old and young, with the youth that has seen both heights and depths, and trembled with great emotions, the age that defies time with a dauntless bravado

Jim, on their rich, far-reaching farm.

"We must write to Connie at once,"

Jerry was quick to protest. "New, father, please! Is that your ider of freedom? Why, if I go to Engleweed to settle down with Aunt Connie I might as well move into a parsonage and be done with it! Freedom! Of course I shall visit them very often, but I shall not live with them, by any means. And I think we'd better not tell her I am coming until I am all nicely settled and running on my own. Then she can't talk me out of it, and all those Starr girls are such good talkers."

Jerry explained. "Of course," assented Prudence. "I think I shall write to Rhode La Faye, and ask her to get me a little

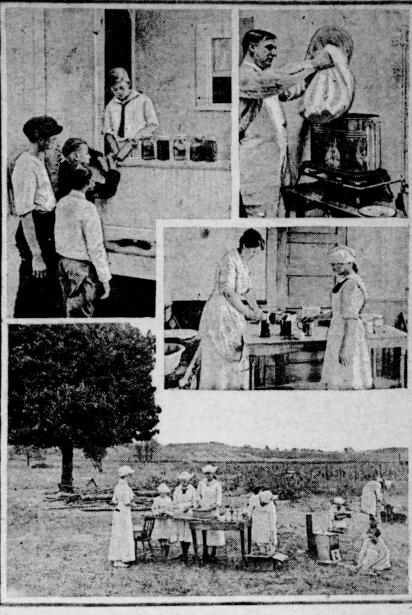

"Oh, she's a girl I knew in college." "Rhoda- See here, Jerry, you don't

> Test both jars and rubbers to make sure they are perfect. Select jars which are appropriate for the fruit or vegetable to be packed. Consider the size of the container from the standpoint of the quantity desired when opened, the size of the fruit or pieces

Wash the jars carefully and place them, side down, in a vessel. Cover with cold water and bring the water to the boiling point and allow it to

While the jars are being boiled sort and grade the fruit or vegetables according to size and degree of maturity. Discard all over-ripe, under-ripe or unsound fruit. Vegetables should be in choice condition for the table to be suitable for canning. After the sorting and grading, wash thoroughly ]

CAN SURPLUS FOOD TO KEEP COST DOWN

Everybody's Doing It-Even Father Takes a Hand in Canning Nowadays.

Don't let any fruits and vegetables go to waste in the garden this summer. When there is more than the family can eat in season, put it in cans to furnish variety in the diet next winter. An abundant supply of fruits and vegetables at all times is essential for health, and from an economic standpoint every family should produce and conserve as much as possible of its food. However, no product which is too ripe for immediate eating should be canned. Above all, do not can bruised, wilted or partly rotten material.

Open kettle canning-fruit and vegetables cooked in a kettle and put in the jars hot-is not a very satisfactory way to preserve certain kinds of vegetables, although it is used successfully with fruits and vegetables like tomatoes. The modern way, and that used by the home-demonstration workers and the boys' and girls' club leaders from the United States Department of Agriculture, is to place food products cold in jars, cover the fruit with sirup or the vegetables with salted water, and then process (heat) the jar and its contents in steam or hot water the required length of time. With this method, the average of success is high and the results are satisfactory, if directions are carefully followed, say pleces, the sirup, brine or seasoning is the Department of Agriculture special-

No expensive equipment is necessary. A washboiler, lard can, or any container with a tighty fitting cover large enough to hold a number of packed jars, and a few other simple utensils generally found in the ordinary kitchen, will do the work. When such equipment is used, a false bottom must be placed in the boiler or other container to prevent the jars coming in contact with the metal. A rack made of strips of wood is probably best for the purpose. The processing or boiling of the jars in the container may be done on the kitchen stove or on a furnace built out of doors.

Several types of canners, by which the work can be done more easily than with a homemade outfit, are on the market. The hot-water-bath canner is the least expensive commercial type. There are two kinds, one that may be placed on the kitchen stove and another which has a firebox and pipe attached and is to be used out of doors. Each has a sterilizing vat, lifting trays, tongs for handling hot jars, false bottoms and tools necessary to use in sealing tin cans. Tin cans or glass

jars may be used with any outfit. There are also steam pressure outfits for home use. They develop a higher temperature than the water-bath canners mentioned. Steam pressure outfits are made to carry from 5 to 30 pounds of steam pressure and are regulated eastly.

Any kind of a glass jar which makes a perfect seal readily may be used. of fruit to be packed, and the ease of processing.

boil for 15 minutes to process the jars.

fore proceeding to pare, core or si

(Prepared by the United States Department | Berries should be washed lightly by placing in a colander and pouring water over them, instead of immersing them in water. Peel, or scrape when needed, and cut large products into pieces of canning size. If the hot jars are not yet ready, cover the prepared product with a clean towel or cover, but the quicker a product is prepared and packed into the jar which has been scalded 15 minutes, the better.

#### What Blanching Does,

The blanch-immersion for a short time in boiling water or live steamgives a more thorough cleansing, improves the texture of the product and insures a clearer liquor in the can. It also shrinks the fruit or vegetable and makes it more flexible. A full pack is then made more easily. The time required for blanching varies with the state of maturity. After blanching the fruit or vegetable place it for an instant in cold water to make it more

Pack in the hot jars, which rest on cloths wrung out of hot water. Fruits cut in half should be arranged with the pit surface down. A thin, slender, flexible paddle made of wood is useful in placing the fruit or vegetable in the jar. When the jar has been packed as full as possible without crushing the added. The paddle is also used to take out bubbles of air after the liquor has been added to the pack.

When the jar is full, put in place a rubber jar ring (which has been boiled in a solution of one teaspoonful of baking soda to one quart boiling water). Put on the caps. When a screw top jar is used, screw the top evenly about half way. When a glass top jar with wire clamp is used, place the lid on evenly and raise both clamps, the upper one fastened to hold the lid in place. When jars equipped with rubber caps and clamp spring adjustment for sealing hermetically are used, the cap should be fastened on the jar evenly with clamp.

#### 

The Canner's Alphabet

A stands for Apple, Can a bushel or two. B stands for Beet,

I like them, don't you?

C stands for Cherry,
Mighty good in a ple.

D stands for Dewberry,

Large 30" x 5" tires on front wheels only \$35 extra. See us today regarding a style of truck to fit your particular

Chevrolet introduces a new one-ton truck, built according to the fundamental policy of this company to provide "Quality at Low Cost".

It has a fine appearance and is specially designed and constructed for commercial service. Its deep 6-inch channel steel frame, hung low to the ground on long semi-elliptic springs, allows the platforms to be placed at the right height for easy loading and unloading.

The powerful Chevrolet motor is famous for its ability to stand up under heavy service. It has well balanced crankshaft thoroughly lubricated, standard 3-speed transmission, fully enclosed dry-plate disc clutch, extra heavy rear axle with large spiral bevel driving gears and rigid one-piece pressed steel housing, heavy truck-type wheels and large tires, full running boards and fenders, Remy generator, starter and distributor ignition, and other quality features.

This truck is not only well adapted to city work but also for use in hilly country and over difficult roads.

For lighter loads there is a Chevrolet commercial 1/2 ton chassis possessing the same quality features, price \$425 f. o. b. Flint, Michigan.

## Pure Half and Half

### **Cotton Seed** In the 1925 State Cotton contest five farmers made

over 3 bales per acre, four of the five planted half and half seed; one of the four won.

If we have a dry season this year, for instance like 1922 and you have little or no grain to sell, you can have cotton as it is a drouth resister Plant one fifth of your crop in cotton and play safe. But don't plant bad or doubtful seed or long season variety of seed and therefore throw away your early moisture and your opportunity to have good pure short season seed like half planted early.

Absolutely pure half and half seed are new on sale at Bailey County Elevator Company, Muleshoe, Texas. The seed are culled, graded and tested and will be sold at \$2 per bushel.

Book your seed now by communicating with

Ray Griffiths

MULESHOE, TFXAS

#### GOOD SUGGESTIONS FOR WINTER LAYER

The successful poultryman knows that the winter eggs are the profitable eggs. He knows, too, that to secure a constant supply of eggs during winter the laying hens must be kept comfortable. The condition of the poultry house at this season is therefore of great importance.

"A hen that uses up the food given her to keep her body warm cannot be expected to lay many high-priced eggs." says Prof. D. S. Weaver of the department of agricultural engineering at the North Carolina State college. "We should look to the condition of the poultry house and see that there is plenty of litter on the floor; that the walls are tight to prevent drafts and that we have windows to admit light and air. These are requisite for heavy production of winter eggs."

Professor Weaver states that the windows should open on the south side of the house and should be equipped with curtains so that they might be raised during the day to admit sunlight and air and closed at night to keep out the cold.

Longer working days for the hens may be secured by installing electric lights, states Professor Weaver. An automatic switch may be used to turn on the lights before daylight in the morning and after sundown in the afternoon. Such a switch will save lots of trouble and add to the egg production when the proper amount of good feed is supplied.

"Nor should we forget that hens like plenty of water in winter," says Professor Weaver. "This water should be ice cold but fresh and pure each

#### Preventive Measure in

Dealing With Diseases

Several years ago sheep producers of the corn belt became convinced that If they were to grow sheep profitably they must rotate their pastures in order to prevent worms from injuring their flock. In more recent years the hag producers have adopted a similar plan in order to avoid many of the diseases that cause loss. At present poultry producers are beginning to realize that many of the diseases that are causing heavy flock losses can be prevented by following plans similar to those adopted by sheep and hog

Most heavy poultry losses can be traced to the fact that the birds are raised on the same ground year after year without paying attention to the prevention of worm infestation or disease infection.

Dr. Charles Murray, Iowa State college, who inspects the sick poultry sent to Ames by Iowa farmers, is responsible for the statement that coccidiosis is the cause of a large perparticular emphasis on the need of and seasons of the year. preventive measures in dealing with the disease.

In all poultry diseases prevention is the best cure. Birds are small and difficult to treat individually.

#### Prevent All Drafts in

To get a good hatch of strong chicks, It is essential to have the incubator in the right kind of a room, properly ventilated, advises the poultry department of the New Jersey agricultural experiment station. A room that will hold an even temperature of 60 to 70 degrees is as important as having an incubator that will hold a temperature of 103 degrees.

If an incubator cellar is used, it should be large enough to provide for the future expansion of incubator capacity. A veiling eight feet in height is preferred, as it permits a layer of air to circulate over the machine and provides room for the expansion tank and other fixtures found on most incubators. 'The length and width of the cellar, of course, will depend on the size of the incubator to be used and the number of machines to be placed side by side. As a rule, an inside width of 12 feet is ample for a single machine and 23 feet if two machines are placed side by side. Have windows (three-light cellar sash) on each side Place them approximately eight feet apart if the building or room is 23 feet wide, and ten feet apart if 12 feet wide.

While the incubator cellar is most commonly ventilated by opening the windows, this method has serious objections. It is rapidly being replaced by the indirect method which provides plenty of fresh air at all times with

#### Overlook Value of Milk

The value of sour milk and buttermilk is often overlooked on the farm. Many times this is thrown into the slops or fed to the pigs when it might much better be given to the laying It provides protein for the production of eggs and assists in maintaining the birds in a healthy condition. When the mash is mixed when the birds receive

y will drink, the meat decreased about one

Invasion of Foreign Diseases and Pests Met With Great Vigor.

(Prepared by the United States Department of Agriculture.)

Three emergencies, each constituting a national menace to the livestock industry, were successfully met during the last fiscal year, according to the annual report of John R. Mohler, chief of the bureau of animal industry. Two of them were outbreaks of foot-and-mouth disease, in California and Texas, while the third was the invasion of the United States by the European fowl pest, a new disease which, though extending to nine states, was successfully eradicated

While emergencies of the kind mentioned are sometimes regarded as occurrences affecting only the live-stock industry, information received from many sources show clearly the serious effect on industry and commerce. These effects extend to unemployment, transportation difficulties, reduced market prices of products, and public unrest. Realizing such consequences, the bureau has met the invasion of foreign diseases and pests with the greatest vigor.

Eradicating Tuberculosis.

In eradicating tuberculosis of live stock the combined state and federal forces tested about 32 per cent more cattle than during the preceding year. Altogether more than 7,000,000 head were officially tested, of which 3.1 per cent were condemned as diseased. This proportion of reactors is a slight decline compared with former years. A waiting list of 3,500,000 cattle at the end of the fiscal year shows the strong desire among cattle owners to have their herds tested.

The prevalence of hog cholera during the year was unusually low, due apparently to the practice of using the preventive-serum treatment, Though the seeming conquest of this disease, which at one time caused enormous losses, is gratifying, the bureau calls attention to its treacherous nature and urges extreme watchfulness in bringing under control promptly any new outbreak that may

Of special interest to live-stock growers on farms and ranches throughout the country are the inwestigations conducted on the goveroment's experiment farms. These are maintained to solve practical problems confronting stock owners in various regions.

Prevent Soft Pork.

One important investigation deals with definite methods of preventing softness and toiliness of pork, a condition due largely to feeding peanuts, soy beans, and other oil-bearing feeds. Numerous state experiment stations, particularly in the South where the problem is most serious, are cooperating with the bureau in this work which is now in its seventh

Studies of interest to sheepmen deal with the rate of wool growth. Practical knowledge on this important centage of the loss among young question is extremely limited, though chickens, especially among those that preliminary work shows that the are over two weeks of age. In out- growth of wool and hair varies conlining the trouble, Doctor Murray lays | siderably during the different months

> Extensive investigations concerning the quality, palatability, and food value of meat were planned during the year covered by the report, in cooperation with state experiment stations, producers, and the meat trade. This branch of research is expected to have an important bearing on the the Incubator Cellar future of live-stock production and public knowledge concerning the food value of meats. In order to provide a means of measuring the quality of meat a machine has been designed for testing the tensile strength of meat fibers and another for measuring the force required to shear or break

but often, so that water should be convenient for them.

Merino is the wool sheep; Shropshire the all-purpose; and Southdown for the best mutton.

The value of milk as a feed for hens is often overlooked. It will prove a desirable addition to any laying ra-

A goat is a better protection for sheep than is any other animal. Dogs fear goats, but the goat has no fear of a dog.

Time and material spent in building a suitable poultry house or remodeling or refurnishing the old will draw good dividends.

Hard, sharp grit for grinding feed, and oyster shells to supply lime for egg shells are both necessary. Neither will replace the other.

Keep the body weight of pullets up during cold weather by feeding liberal amounts of scratch grain, say poultry specialists of the Pennsylvania State

The feeder who does not make sure of a sufficient supply of feed to carry the cattle purchased the desired time or to the desired condition often runs

#### Wheat and Oats as Clover Nurse Crops

Tests Show There Is No Marked Difference.

Tests made for many years by the experiment station of the University of Illinois show that there is no marked difference between winter wheat and oats as nurse crops for clover, according to H. J. Snider, assistant chief of the soil experiment fields. Farmers who plan to sow red clover this spring can seed it in either of these grains and get about the same results, provided other conditions are equal and favorable for growing of clover.

In a rotation of corn oats, wheat and clover on the McNabb experiment field in Putnam county, red clover had been seeded in winter in a cow testing association, fed in acwheat for 17 consecutive years, from 1908 to 1924, and out of these 17 vice easily average 300 pounds of butseedings more than 76 per cent of Rockford field. Winnebago county, in rotation of corn, corn, oats and clover, red clover has been seeded in most 88 per cent of them have been successful. On the Davenport plots in Champaign county clover has been seeded in oats for 22 consecutive years, 1903 to 1924, and more than 77 six farmers with a hired tester who, per cent of these seedings have been successful.

Although the question as to whether or not winter wheat or oats afford the lest nurse crop and seed bed for red clover is a point open to argument, the results of these longcontinued experiments indicate that there is little difference between the

When only oats are used as a small grain crop, as is the common cornbelt practice, the only choice in the matter of a nurse crop for clover is the selection of a variety of oats which may give the greatest advantage to the young clover.

#### Mottling of Soy Beans

Controlled by Breeding

Mottling, an undesirable character of soy beans which has attracted a good deal of attention from growers during recent years, seems to be largely the result of environmental conditions, but there also are indications that it may be controlled to some extent by breeding, according to the Illinois College of Agriculture. This mottling, which consists of irregular patches, blotches or bands of black or brown on yellow or green soy beans, is undesirable because, for one thing, it arouses the suspicion that the mottled variety is not true. It also interferes with the correct identification of varieties and is particularly objectionable in seed certification because it brings up the question of

purity and trueness to variety type. That breeding may be a means of controlling motthing is indicated by the fact that certain varieties show a greater tendency to mottle than others, although they are all grown under the same conditions. Midwest, Ito San, Manchu and Hongkong all mottle considerably when grown on the college farm, while Dunfield and certain selections of the A. K. variety show little or no mottling.

#### Angleworms Are Great

Improvers of the Soil

Angleworms are great improvers of the soil. The holes they make in it admit air, and, especially in heavy clay, are followed down by roots deeper than the roots would otherwise go.

But the chief good done by angleworms is in pulverizing much soil which passes through them as foodthe vegetable matter in it serving this purpose. Charles Darwin estimated that an average of ten tons to the acre was thus annually treated -enough to cover the land a fifth of an inch deep. This is rich manure. It sounds extravagant until you think how plentiful angleworms are. Mr. Darwin figured that they number 50,000 to the acre of garden soil and 25,000 to the acre of meadow land. Poor soil has few angleworms. One of the benefits of plowing veg-

etable matter into it is that the humus thus made attracts them. Only give 'em humus and they move right in and go to work free to help you build a bang-up good farm.

#### Use of Alfalfa Favored

for Fattening the Pigs

The usual ration of corn and tankage for fattening pigs can be greatly improved in efficiency if the pigs are given some alfalfa hay. This fact was recently established by the South Dakota Agricultural college. An analysis of the feed records show that the largest amount of hay was consumed by the pigs when they were under 150 pounds in weight.

The experiment included two lots of six pigs each, averaging 64 pounds each at the start. One lot received corn and tankage, self-fed, and made a daily gain of 1.33 pounds per pig. One hundred twenty-one days were required to reach an average weight

of 225 pounds. The second lot received alfalfa in addition to the corn and tankage. The average dally gain per pig was 1.65 pounds, and an average of 225 pounds was reached in 98 days, which was 33 days earlier than the first lot fed only corn and tankage. The alfalfa lots showed a marked advantage in thriftiness and in economy of gains

#### RECORDS ON COWS SHOW NET INCOME

Join a cow testing association, feed for economical production, and weed out the tramp cows. Profits will follow just as they have on hundreds of other farms where the milk is tested regularly by a competent tester, states A. J. Cramer, in charge of cow testing work in Wisconsin for the United States bureau of dairying, the Wisconsin Dairymen's association, and the Wisconsin College of Agriculture.

The cows in well-kept herds tested cordance with the efficient tester's adterfat a year, Cramer reports. On the them have been successful. On the other hand, 12 months' records on 15 poor cows in Wisconsin cow testing associations show an average of 100 pounds of butterfat valued at \$50. On oats for 15 consecutive years, 1905 to these cows the average feed cost was 1919, and out of these 15 seedings al- \$47, leaving only \$3 income over feed cost. Cramer asks: "How many such cows can farmers afford to keep?"

The cow testing association in Wisconsin is composed of about twentyusually, is at least a graduate of the short course at the Wisconsin College of Agriculture. The tester spends one day a month on each farm and while there, according to Cramer, gets a complete record of milk and butterfat production for each cow in the herd. He also obtains feed consumption costs, costs of feed, and figures in-

come over feed cost. Using these results as a guide, Cramer tells how the farmer and the tester figure out together better methods of feeding and of care and management of the herd. They plan to eliminate all cows that do not respond profitably to intelligent feeding and they give attention to problems of breeding. Many times the tester has been an aid in helping the members of his association to obtain higher prices ranging from \$10 to \$25 more per cow for cow testing association cows with records.

Wisconsin's 162 cow testing associations are on the march toward a more economical dairy production system for the state.

#### Variation in Production of Milk Due to Feeding

Dairymen are often puzzled as to the explanation of why two cows of the same age, breeding, and under similar management vary so widely in milk production.

In a study to determine the underlying cause of this variation the dairy department of the Missouri College of Agriculture kept exact feed and production records of two cows of similar breeding. It was found that the cow producing the largest amount of milk and butterfat consumed a great deal more feed than the cow producing only a small amount of fat. From this it is concluded that the underlying reason for the variation in the milk production of cows is due to the difference in the amount of feed they are able to consume and use above that required for maintenance. Both cows were equally efficient in digesting the feed which they received. In other words, a cow is a large producer because she is able to consume a large amount of feed above the maintenance requirement and uses this feed for the production of milk. This, of course, means that a cow must have a large udder containing a large number of cells which secrete milk. On the other hand, the small producer has a small capacity for feed and also mammary glands,

#### Form of Milk Pail

The form of milk pail used in milking is an important factor in eliminat ing contamination of the milk. The Geneva station found that ordinary 12-quart pails to which had been soldered covers with oval openings 5 by 734 inches, were most satisfactory. These covers were suffciently convex so that the entire inside of the pail could be easily observed and readily cleaned. Their height was only 121/2 inches, so that they could be comfortably used in milking short-legged or heavy-uddered cows.

Prevent Bacteria in Milk

It is a common practice with some dairymen to brush their cows just be fore milking. In a study of this problem it was found that there was uniformly a higher number of bacteria in the milk drawn from the cows which had just been brushed than there was in the milk drawn from the cows which were milked before the brushing was done. These results are not surprising to those who appreciate the fact mally carry very large numbers of

#### SOUND TO RAILS, ESCAPES DEATH AS TRAINS PASS

#### Boy Victim of Bandits Describes His Sensations While Lying Helpless.

Mexico City.—Few youths of fourteen have gone through such a nervewracking experience as Casar Castro, student here, and lived to tell the tale. His escape from death, tied between railroad rails while a train passed over him, has all the earmarks of a film thriller, the only difference being it was real.

Young Castro, on his way to school one morning, was waylald by robbers who whisked him off in an automobile chloroforming him at the same time. They relieved him of a gold watch, and when he regained consciousness several hours later he found himself bound, gagged and helplessly tied on the railroad tracks leading into Mexico city. He struggled in valu.

Lost Consciousness.

The boy's story indicates what must have been his feetings when the first of the several trains that were to run over him came along about 11 o'clock

"I Considered I Was Dead.

in the morning. It was a freight train. Castro says: "I considered I was dead as I heard the terrible noise of the approaching train. You have no idea what it is like to 'feel' the approach of what you think is certain death." Castro added he closed his eyes, prayed to God, and instinctively "made himself as small as possible," then lost consciousmess.

He regained it some time later. The train had gone over him without so much as tearing the clothes on his slender body. In the afternoon two more trains came along. Castro explained later that "although I was afraid, the morning experience made matters much easier for me, for I realized that if I made myself as small as I could the other trains would go by without touching me." Each time the trains approached the boy lost consciousness, but he came to in time to prepare for the next train.

He was found at 6 o'clock in the evening quite by chance and he was numb and unable to move.

#### THE PASSING DAY

WILL H. MAYES Former Dean

Department of Journalism University of Texas

Honesty Needed in Government.

This is an election year in Texas many politicians are laying their campaign plans for getting into of-fices. There will likely be numerous canlidates for all positions from the low-est to the highest.

They will go before the people with all kinds of statements and promises. Comparatively few of those who offer will be qualified for the offices they hope to secure. Most people seem to think that they can fill any office that offers sufficient remuneration. In other words they care far more for the pay than for the service they render. To accept an office with that feeling is positively wrong—it it dishonest, because it is getting pay for a service for which one is but poorly qualified. There is but a short step from that to plain graft. The man who seeks pay for a serv ice he is unfitted to do is likely to justify himself in getting money without any service rendered. Do not be too quick to promise support to any candidate, and, be certain above all things, that those for whom you vote are honest through and through.

Confidence is Greatest Public Need. There is an appalling lack of confidence in public officials. This is evident wherever you hear public matters discussed, and many are ready to cite case after case to show that the mass of office-holders are corrupt. This feeling has reached such a point that many hesitate to ask for an office because they fear their motives will be impugned. They object to the company with which they will have to run, and to be frank about it, the company isn't the best always. Patriotism among office-seekers and office-holders has reached a mighty low ebb. This condition speaks badly for democratic form of government, but only the public can correct it. Men and women in whom confidence can be placed must be elected to officepersons of unquestioned integrity. Confidence in the government is based on confidence in its officers. can only be restored by the right ex-

ercise of the ballot. Libel Laws Largely to Blame.

Newspapers no longer can be the guardians of the rights of the public, because they are hedged about by too many restrictions. Libel laws prevent the publication of matters about which the people should know. Libel suits are expensive to publishers. Whether guilty of libel or not, they must employ attorneys to de-fend them and must incur other expenses whenever any one feels in-clined to sue them. Newspapers are muzzled by the fear of law suits more than by the fear of having to pay damages for libel. The person who brings a libel suit and fails to maintain it should not only have to pay court costs, but in addition should be made to pay attorney's fees and other costs incurred by the defendant. Until that is done there will be no such Interior in inspecting the site have thing as freedom of the press. Without such freedom there is no possibility of such publicity as will guarantee good government. The press does not wish, and should not have immunity from libel, but immunity from the expense of unjustified libel suits,

#### Texans Have Big Plans.

Texas is starting in to do things in a big way this year, and each section is vieing with all the others in its efforts. Every part of the state that ne ds irrigation and can get it is planning to that end. Many of the projects are already under way and will be far along before the year is ended. Vast sections are studying how they can bring the overflow lands into successful cultivation. There is more oil development than the state has ever known before. Sulphur and potash will bring great riches to certain parts of the state. The crop production will likely be limited only by the number of laborers that can be obtained. Prosperity is in evidence everywhere, and enforced idleness is unknown. It is great to live in a state that is up and doing.

Educators Should Lead in Education. Dr. Meikeljohn, former president of Amherst College, in a recent lec-ture in Austin, said in substance that educators are to blame for any failure of a democracy. He reasons that democracy depends for success upon an educated people; but that learning must be of a kind to maintain the best government; and that what learning is best should be decided by scholars, instead of by politicians who are too often unlearned. He attributes the failure of democracy, to whatever ex-tent it fails, to lack of courage on the part of scholars in directing the scholarship of the country. They are too much inclined to follow the lines of least resistance and "leave it to George," the politician, to have such things taught as best serve his political ends rather than the interests of government. of government.

#### Ferd Lehmann's Death.

The entire country press of Texas and many daily papers of the state have been saddened by the death of Ferd Lehmann, once editor of the Hallettsville Herald and for 29 years treasurer of the Texas Press Association. It is impossible to pay a tribute that measures up to the life of such a man. He was a true friend, a good man, and in all things dependable. What more could be said of any one? He will be greatly missed by most of the editors of Texas and by all who knew him, for they loved him as a brother.

#### CITIZENS PAYING FOR GOOD ROADS

Transportation is today vital to all businesses. The enlarged field of operation most business firms have opened up during the last few years has brought about radical changes in the conduct of trade. Statewide and national distribution has taken the place of community and county trade. Adequate highway transportation is needed to facilitate widening distribution. These facts have been determined by a national survey into highway problems conducted by the American Association of State Highway Offiwials.

Because of this changed trade aspect the association finds real need for continuation of the federal aid highway act as it exists today. The act has enabled states to build according to a national plan, rather than to a disjointed local building program.

Many interesting facts have been brought to light by this investigation of the association. The ordinary commodities of everyday trade are cited as examples of the influence of highway transportation on trade distribution. Sugar is produced in a few concentrated sections or imported. Without adequate distribution the price of this common commodity would vary greatly over the country. With railroads and improved highways, transportation has brought about a more uniform price level.

The identical situation exists in crackers, tobacco, cereal, radiators, cans, and the wares of such retailers as the five and ten-cent stores. While the manufacturer and general business of the makers and sellers of these commodities may be concentrated in one locality their business is dependent solely upon their ability to get their goods to the buyer with a minimum loss of time and expense.

More and more, the association finds, these goods are being distributed by motor truck on the highways. This is especially true of the movement of goods from centralized warehouses to the consumer or retailer. This movement is growing in direct proportion to the increased miles of improved roads being built over the

#### Plan Road Along Top of

Mountains in Virginia 75-mile highway along the summit of the Blue Ridge mountains in Virginia may be built by the federal

government. The proposed highway would pass through the heart of the new Shenandoah National park and would look down upon the most famous valley in America, Shenandoah, "daughter of the stars."

The proposed Shenandoah National park area extends 75 miles along the Blue Ridge, beginning at Front Royal, a 75-mile automobile ride from Washing-

ton, and ending in Waynesboro. Engineers of the Department of the recommended the proposed highway not only as practical, but as furnishing an opportunity for one of the most beautiful scenic routes in America.

The highway would have an average altitude of more than 3,200 feet, and it would wind around 20 mountain peaks on the top of the Blue Ridge, which is almost level.

Engineers found thousands of tons of rock suitable for the highway, which would greatly reduce the cost. The highway would run by a number of waterfalls, several of them

more than 100 feet in height. It would pass through much virgin forest and along the edges of precipices from which the traveler can gaze for miles across the Shenandoah valley. On a clear day, it is said, the Washington monument, 75 miles distant, is easily discernible from the peak. From the mountains can be seen thousands of acres of apple orchards and land in farms in the "granary of the Cop federacy."

#### Good Roads Notes

Narrow roads are stupid and they are also dangerous.

One topic on which opposing sides in any dispute can all agree is that of roads. The country needs more goods roads. Everybody says so. Nobody denies it.

Ten years from now, according to the law now in effect, the United States may have 200,170 miles of completed, well-paved highways. At present, there are only about 27,000. miles of such roads. The federal ald system calls for this work in co-op-eration with the states.

There is not sufficient increase in first-class road area to park adequately the new machines turned out each year! And the reason is the lack-or

the imagined lack—of money.

More than \$17,000,000 will be spent on Washington state's pay-as-you-go road-building program during the coming blennium. Of this sum it is estimated \$14,500,000 will be available from licenses for motor vehicles, and a tax of 2 cents a gallon on gasoline, \$2,250,000 from federal aid, and nearly \$500,000 from forest funds.

#### WINTER

Old Man Winter was very busy. Before long he would be taking his departure, but before Mistress

Christine's Birds Came.

time.

He went to the country places and gave them a fresh snowstorm at night, so when they awoke the next morning the trees, bushes and fences were covered

active.

with a soft white snow and little icicles on the top shining in the sun like diamonds. He made it look like Fairyland-it was a wondrous sight to greet every-

one as they gazed upon it when morning came. He spread great blankets of snow

over the fields and said: "Still time for another sleep." He kept on sending snow to them so that the blanket became thicker all the

Then he sent a milder day to other places so that the snow melted and everyone went out to shovel their roofs so the snow would not melt too quickly and leak down into the rooms. But in other spots he made the snow so high that it reached the window ledges of the down-stairs

He sent such heavy falls of snow is some sections that the people were snowbound and the train could not

On all sides was snow. The snow in people's front yards was as high and tall as a man is tall.

Little Christine, who always looks after the birds through the cold winter, brushed off a covered porch where she put the bread crumbs for her little

Snow, or no snow, Christine's birds came to visit her. They knew she would have breakfast for them, no matter how bad a storm it had

For she always had a cleared space for her birds, even when the snow banked up high in the yards. How the hungry little creatures did

appreciate what Christine did for them! They were loyal to her, as she was

loval to them. The snow was too deep and too soft for them to alight on it, but Christine always found a Then in yet other places Old Man

Winter just kept on sending snow, so that there were piles and piles of snow. You really hardly ever saw anything to equal it.

People took pictures of the great piles of snow and sent them to their friends who lived where the flowers were blooming to show them how different the weather could be when Old Man Winter really paid a good visit. He covered up the roofs and made the houses seem taller with their add-

ed snow height. People made narrow paths so they could walk along the streets of the

villages. Bailey, who was also a great lover of birds, shoveled little clear spaces for his small friends and saw that they did not starve.

They found out so quickly where he had breakfast ready for them.

At his party were five sparrows, two woodpeckers, two chickadees, one starling and a nuthatch.

But others had winter-time appetites, too. Little Maggle who likes meals pretty well herself, invited a friend named Dorothy for afternoon chocolate, and Dorothy ate five pieces of bread and butter and six patty cakes and drank three cupfuls of chocolate!

Old Man Winter said he certainly

could give people appetites. He visited the cities, too, but he let Old Grimy go along right afterward so that the snow became dirty and horrid looking in a very short time.

Old Grimy had many children, and they were dirty, too, and as they played in the city snow, it all became so dirtyevery snow bank was almost black instead of white. And then Old

Afternoon Choc-, olate. Man Winter de-

cided he would not be so energetic much longer. The snow began to disappear.

. It was strange how it melted away, and, from having been so high that one couldn't believe it would ever go,

there was less and less. For the snow could disappear when it started to feel like it, and no one could see just how or where it went!

**HOW TO GET RID** 

OF COLDS AND

**CATARRH** 

A Simple, Safe, Inexpensive

Method That Clears Out the

Head, Nose and Throat.

There are many people suffering from chronic catarrh who would like

to know how they can stop catching

cold after cold, for they must realize

that sooner or later this may lead to deafness and other serious troubles.

Dr. Blosser, for years a specialist in

catarrh, is the discoverer of a pleas-ant, direct method that can be used

by women and children as well as

men. His remedy is made from medi-

cinal herbs, flowers and berries which you smoke in a dainty pipe or cigar-ette, and inhale the vapor into the

air passages of the head, nose, throat

and lungs, carrying medicine where sprays, douches and salves cannot

possibly reach. It contains no cubebs,

tobacco or habit-forming drugs.
Dr. Blosser's Remedy is effective in

all forms of colds, catarrh, catarrhal headaches and ear troubles that may

lead to deafness. You will breathe

If you suffer from catarrh, asthma, catarrhal deafness, or if subject to frequent colds, you should try Dr. Blosser's Remedy which may be had at any drug store; or if you desire proof of its beneficial and pleasant effect

beneficial and pleasant effect, send ten cents (coin or stamps) to The Blosser Co., 70 G H. At-lanta, Ga., for a trial package.
